RQ1: Can we quantify interest of TD at the functional level? How much is the interest? (Version 5)

Yasutaka Kamei

Feb 13th, 2016

What's new in the version 5?

- Add histgrams

What's new in the version 4?

- We used the new dataset that solves one bug that is fixed by Everton.

Data Load

```
setwd("/Users/kamei/Research/techdebt/msr16_td_interest/")
source("./r_scripts/data_read.r")
```

Data Summary

- (Step 1) choose one of duplicated method and version name
- (Step 2) only use technical debt including metrics

```
nrow(data)
```

```
## [1] 837
```

```
apply(data.s1[,c("version_name","CountInput_v1","CountInput_v2")], 2, function(x){sum(x == -1) })
```

```
##  version_name CountInput_v1 CountInput_v2
##             8           221            94
```

Observation

- The number of methods that cannot be linked between Evernton's data and metrics data

    - 171 => 221 (introducing)
    - 101 => 94 (being found as last version)

1

(Step 3) use technical debt including non 0 for division

CountLine

```r
summary(data.CountLine.all$Project)
```

```
##    apache-ant apache-jmeter        jruby
##            71           181          236
```

```r
summary(data.CountLine.positive$Project)
```

```
##    apache-ant apache-jmeter        jruby
##            27            80           77
```

```r
summary(data.CountLine.negative$Project)
```

```
##    apache-ant apache-jmeter        jruby
##            20            25           59
```

```r
summary(data.CountLine.positive$Project) / summary(data.CountLine.all$Project) * 100
```

```
##    apache-ant apache-jmeter        jruby
##      38.02817      44.19890     32.62712
```

```r
summary(data.CountLine.negative$Project) / summary(data.CountLine.all$Project) * 100
```

```
##    apache-ant apache-jmeter        jruby
##      28.16901      13.81215     25.00000
```

CountInput

```r
summary(data.CountInput.all$Project)
```

```
##    apache-ant apache-jmeter        jruby
##            68           161          231
```

```r
summary(data.CountInput.positive$Project)
```

```
##    apache-ant apache-jmeter        jruby
##            21            68           70
```

```r
summary(data.CountInput.negative$Project)
```

```
##    apache-ant apache-jmeter        jruby
##            13            13           37
```

```r
summary(data.CountInput.positive$Project) / summary(data.CountInput.all$Project) * 100
```

```
##    apache-ant apache-jmeter         jruby
##      30.88235      42.23602      30.30303
```

```r
summary(data.CountInput.negative$Project) / summary(data.CountInput.all$Project) * 100
```

```
##    apache-ant apache-jmeter         jruby
##     19.117647      8.074534     16.017316
```

Observation

- The number of all methods is 837

  - (s1) 754
  - (s2) 488

- We use 71, 181, and 236 methods including technical debt.

  - The data set we used had 67 (ant), 169(jmeter) and 268(jruby) technical debt.

- 32.6%-44.2% of technical debt has positive interest.
- 13.8%-28.7% of technical debt has negative interest.

CountLine

```r
# interest of CountLine (LOC)
fc <- factor(data.CountLine.all$Project)
interest <- data.CountLine.all$interest
tapply(interest, fc, summary)
```

```
